CNC Machine Tools Training and Skill-Building |Denford

Micromill

eLearning Course: 95-CNC1D

CNC mills are used to create a variety of parts and components in the manufacturing industry. A CNC (computer numerical control) mill uses a computer to control the movement of its cutter and table creating more accurate and consistent parts at a faster speed than a manual mill. Amatrol's CNC Machine Tools Learning System teaches basic safety and operation of the CNC mill as well as programming fundamentals such as: linear interpolation, startup and shutdown blocks, tooling selection, locating zero, absolute and incremental positioning and circular interpolation. This system also covers essential CNC skills like calculating the speeds and feeds for CNC operations, how canned cycles and subprograms are used to simplify CNC programs, and how to use cutter compensation.

Amatrol's CNC Machine Tools Learning System consists of a Denford CNC milling machine with VR milling software and a tooling package. This system includes printed curriculum, but also offers optional interactive multimedia for an online learning experience. The CNC Machine Tools Learning System teaches the fundamentals of CNC machining using real world applications and industrial grade components.
